

## **Thoughts about Doing a project and Learning through a project**

Doing a project means finishing the assigned task by following the given instructions, and trying to complete it within the stipulated time. The main focus is on completing tasks efficiently and ensuring that the end result matches the expectation. Skills and knowledge are gained during the project but usually they are byproducts of the process rather than the central purpose. We simply focus on project completion and there is lesser creativity.

Learning through a project promotes creativity. Here, the focus is not just on finishing but on understanding, exploring, and experimenting as we work. We try out different ideas, learn from mistakes, and discover new ways of solving problems. This kind of approach gives a learning experience, because it's not just about finishing the project, but it's about gaining skills, confidence, and a deeper way of thinking that can be applied in the future.
